

AT A GLANCE

We utilise our vast experience and knowledge to act as professional assessors with respect to the security architecture of our clients' networks by performing a comprehensive network architecture audit including analysis & optimisation of vulnerabilities against industry best practices.

Our auditing service enables our clients to identify how their network architecture and controls are protecting critical assets, sensitive data stores and business-critical interconnections in accordance with their organisation's business and security practices.

KEY SERVICE FEATURES

- We determine security strategies and support our clients' business objectives
- We implement policies where required and we establish new policies should they be required
- We put in place effective risk mitigation and regulatory compliance.
- We analyse, manage and report
- We review existing policies and frameworks and make recommendations where necessary
- We audit existing policies for example ISO 27001/PCI to ensure compliance
- Our aim is to set out a road map detailing short, medium and long-term goals

METHODOLOGY

For each key area, and for the infrastructure as a whole, we identify and document the following 4 steps:
